

The tablets weigh 10 grams and last 2-3 years in the ground.

The 10kg box has about 990 tablets in them. We also sell bags of 20, 50 and 100 tablets.

Slow Release Fertiliser Tablets

Lasts 2-3 years in the ground

Putting fertilizer tablets in the hole when you plant is good as it increases their growth rates. This includes foliage, stem and roots. You need the roots to get established so they can get moisture and nutrients. A well established root system can make the difference between success and failure when the summer comes and the ground dries out. It also helps a great deal in windy areas as the roots will anchor the plant down better.

Continuous slow release of nutrients for up to 3 years to get plants well established. Place fertiliser tablets in hole against roots when planting.

Small size plants (under 40cm high): 1-2 tablets.

Medium size plants (40cm to 1m): 2-5 tablets.

Large size plants (over 1m): 5 plus tablets.

Slow release tablets typically contain:

Nitrogen	20.00%	Phosphorus	4.00%
Potassium	4.00%	Sulphur	2.00%
Magnesium	2.00%	Calcium	1.50%
Boron	0.06%	Copper	0.10%
Iron	0.75%	Manganese	0.25%
Zinc	0.25%
